

Runtime API Examples

This page demonstrates usage of some of the runtime APIs provided by VitePress.

The main `useData()` API can be used to access site, theme, and page data for the current page. It works in both `.md` and `.vue` files:

```
<script setup>
import { useData } from 'vitepress'

const { theme, page, frontmatter } = useData()
</script>
```

Results

Theme Data

```
<pre>{{ theme }}</pre>
```

Page Data

```
<pre>{{ page }}</pre>
```

Page Frontmatter

```
<pre>{{ frontmatter }}</pre>
```

Results

Theme Data

Page Data

Page Frontmatter

More

Check out the documentation for the full list of runtime APIs.
